CONCEPT DEVELOPMENT

Mathematics Assessment Project

CLASSROOM CHALLENGES

A Formative Assessment Lesson

Representing and Combining Transformations

Mathematics Assessment Resource Service
University of Nottingham & UC Berkeley

Representing and Combining Transformations

MATHEMATICAL GOALS

This lesson unit is intended to help you assess how well students are able to:

- Recognize and visualize transformations of 2D shapes.
- Translate, reflect and rotate shapes, and combine these transformations.

It also aims to encourage discussion on some common misconceptions about transformations.

COMMON CORE STATE STANDARDS

This lesson relates to the following *Standards for Mathematical Content* in the *Common Core State Standards for Mathematics*:

8.G: Understand congruence and similarity using physical models, transparencies, or geometry software.

This lesson also relates to the following *Standards for Mathematical Practice*, with a particular emphasis on Practice 7.

1. Make sense of problems and persevere in solving them.
3. Construct viable arguments and critique the reasoning of others.
5. Use appropriate tools strategically.
6. Attend to precision.
7. Look for and make use of structure.
8. Look for and express regularity in repeated reasoning.

INTRODUCTION

- Before the lesson, students work individually on an assessment task that is designed to reveal their current understandings and difficulties. You then review their work, and create questions for students to consider in order to improve their solutions.
- After a whole-class introduction, students work in small groups on a collaborative task.
- In a whole-class discussion, students review the main mathematical concepts of the lesson.
- Students return to their original task, and try to improve their own responses.

MATERIALS REQUIRED

- Each student will need two copies of the assessment task, *Transformations,* one copy of *L-Shapes* (printed on transparency film), and a map pin or thumbtack.
- Each small group of students will need one copy each of *Card Set A: Shapes* and *Card Set B: Words* (cut up before the lesson), a copy of the transparency *Transformations* (printed on transparency film), a mini-whiteboard, a pen, an eraser, a glue stick and a large sheet of poster paper (optional).
- You will need an overhead projector for demonstrating the transparencies to the whole class.
- For an extension activity you will need several copies of *Card Set C: Additional Words*, and several pairs of scissors.
- There are some projector resources to support discussion.

TIME NEEDED

15 minutes before the lesson, a 1-hour lesson, and 10 minutes in a follow-up lesson (or for homework). Timings are approximate and will depend on the needs of the class. Before the lesson

BEFORE THE LESSON

Assessment task: *Transformations* (15 minutes)

Ask students to complete this task, in class or for homework, a few days before the formative assessment lesson. This will give you an opportunity to assess the work, to find out the kinds of difficulties students have with it. You should then be able to target your help more effectively in the subsequent lesson.

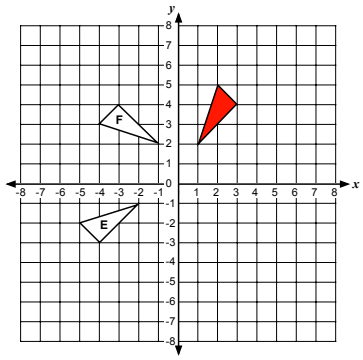
Give each student a copy of the assessment task *Transformations*.

> *Read through the questions and try to answer them as carefully as you can.*

It is important that, as far as possible, students are allowed to answer the questions without your assistance.

Students should not worry too much if they cannot understand or do everything, because in the next lesson they will engage in a similar task, which should help them. Explain to students that by the end of the next lesson, they should expect to be able to answer questions like these confidently. This is their goal.

Transformations



1. Draw the shaded triangle after:
   a) It has been translated −7 horizontally and +1 vertically. Label your answer *A*.
   b) It has been reflected over the *x*-axis. Label your answer *B*.
   c) It has been rotated 90° clockwise around the origin. Label your answer *C*.
   d) It has been reflected over the line $y = x$. Label your answer *D*.
2. Describe fully the single transformation that:
   a) Takes the shaded triangle onto the triangle labeled *E*.

   b) Takes the shaded triangle onto the triangle labeled *F*.

Assessing students' responses

Collect students' responses to the task and make some notes on what their work reveals about their current levels of understanding. The purpose of doing this is to forewarn you of the difficulties students will experience during the lesson itself, so that you may prepare carefully.

We suggest that you do not score students' work. The research shows that this will be counterproductive, as it will encourage students to compare their scores and will distract their attention from what they can do to improve their mathematics.

Instead, help students to make further progress by summarizing their difficulties as a series of questions. Some suggestions for these are given in the *Common issues* table on the next page. These have been drawn from common difficulties observed in trials of this unit.

We suggest you make a list of your own questions, based on your students' work. We recommend you either:

- Write one or two questions on each student's work, or
- Give each student a printed version of your list of questions, and highlight the questions for each individual student.

If you do not have time to do this, you could select a few questions that will be of help to the majority of students and write these on the board when you return the work to the students in the follow-up lesson.

Common issues:	Suggested questions and prompts:
Confuses the terms 'horizontally' and 'vertically' For example: The student translates the shaded triangle –7 units vertically and +1 units horizontally in Q1a.	• Look at the start of the word 'horizontally'. What are we referring to when we talk about the horizon? Which way is this?
Translates rather than reflect the shape (Q1b) For example: The student has translated the shaded triangle vertically –7 units and so omitted to draw the mirror image.	• If you were to place a mirror on the x-axis, what would the reflected image look like?
Confuses the terms 'clockwise' and 'counter clockwise' For example: The student rotates the shaded triangle counter clockwise (Q1c.)	• Think about the direction of the hands on a clock. This direction is 'clockwise'.
Ignores the center of rotation and rotates from a corner of the shaded triangle For example: The student rotates the shaded triangle around the point (1, 2) (Q1d.)	• Where is the center of rotation? • Mark the center of rotation and draw a line to a corner of the shape. Where will this line be once it has been rotated?
Uses an inefficient combination of transformations For example: The student describes the transformation in Q2a as "a reflection over the *y*-axis, followed by a rotation 90° counter clockwise around (–1, 2), followed by a translation –1 unit horizontally and –3 unit vertically".	• Is there a single transformation that will take the shaded triangle directly to the triangle labeled E?
Correctly answers all the questions The student needs an extension task.	• Find a combination of two transformations that could be replaced by a single one.

SUGGESTED LESSON OUTLINE

Whole-class interactive introduction (15 minutes)

Give each student the transparency *L-Shapes* and a pin (to help find centers of rotation).

Using transparencies encourages students to test different transformations. Working dynamically should deepen students' understanding of transformations in a way that simply drawing shapes on a graph does not.

Introduce the lesson by using Slides P-1, P-2, and P-3 of the projector resource.

Ask the students where they think the image of the *L-Shape* will be after it has been translated, reflected, or rotated in different ways:

Where will the L-Shape be if it is translated −2 units horizontally and +1 units vertically?

Where will the L-Shape be if it is reflected over the line $x = 2$?

Where will the L-Shape be if it is rotated through 180° around the origin?

Ask volunteers to demonstrate their answers by placing their grid and *L-Shape* on the overhead projector. Discuss these positions with the rest of the class, and encourage students to challenge their peers if they think the *L-Shape* has been positioned incorrectly.

Once the correct position has been agreed upon, move on to the next transformation.

You may also want to move the *L-Shape* to a different position on the grid, and ask students:

What transformation will move the L-Shape to this new position? Show me.

Collaborative work (30 minutes)

Ask students to work in groups of two or three.

Give each group *Card Set A: Shapes* and *Card Set B: Words* and a copy of the transparency *Transformations*.

You are now going to continue to transform L-Shapes.

You've got six shape cards, each showing a different L-Shape, and eight word cards each of which describes a different transformation.

Introduce the activity by using Slide P-4 of the projector resource:

Matching Cards

1. Take turns to match two shape cards with a word card. Each time you do this, explain your thinking clearly and carefully.
2. Your partner should then either explain that reasoning again in his or her own words, or challenge the reasons you gave.
3. It is important that everyone in the group understands the placing of a word card between two shape cards .
4. Ultimately, you want to make as many links as possible.
5. If possible, use all the shape cards, and all the word the cards.

You may wish display these instructions.

You have two tasks during the paired work: to make a note of student approaches to the task and to support student reasoning.

Make a note of student approaches to the task

Listen and watch students carefully. In particular, listen to see whether students are addressing the difficulties they experienced in the assessment. For example, are students having difficulty rotating a shape around (2,0) or reflecting a shape over the lines $y = x$ and $y = -x$? You can use information about particular difficulties as a focus for the whole-class discussion later in the lesson.

Support student reasoning

Use the questions in the *Common issues* table to help address misconceptions.

Encourage students to explain carefully how they have made each connection.

> *Lian, please explain why you've linked these two shapes with this transformation.*
>
> *Laura, can you repeat Lian's explanation in your own words?*

Ask students:

> *How does folding the L-Shape along the line of reflection help when reflecting the shape?*
>
> *How does drawing a line from the center of rotation to a corner of the shape help when rotating the shape?*

Students who are struggling should be encouraged to concentrate on linking Shape Cards A, B, C and D.

Further transformations

Once students have completed their arrangement of cards, give them a copy of *Card Set C: Additional Words* and a pair of scissors.

Ask students to add an appropriate transformation, where possible, between any shape cards that have not yet been connected.

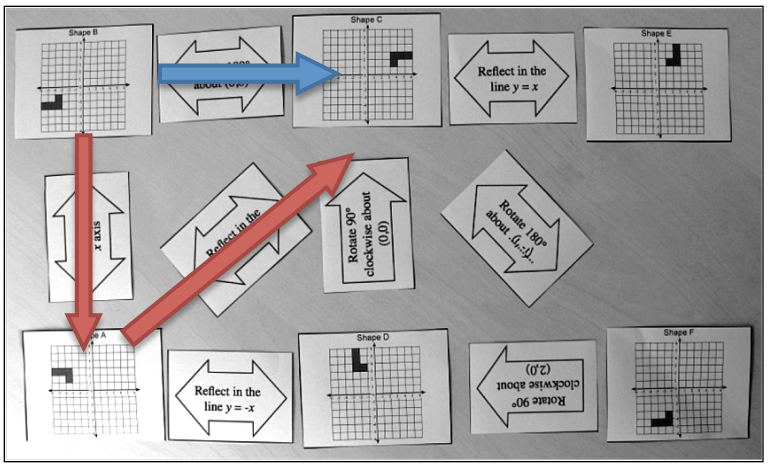
On completion, students may then glue the cards on a poster. They will need a glue stick and a sheet of large poster paper to do this.

Extension task

If a group of students successfully completes the task:

Can you find a combination of two transformations that could be replaced by a single one?

[*For example, reflect B over the x-axis B onto A, then reflect A over the y-axis onto C. These two transformations can be replaced by a single transformation: rotate B through 180° around the origin onto C. This can be seen on the example arrangement below.*]



Students should be encouraged to investigate whether or not this is always the case:

For any shape, will this combination of transformations always replace this single one?

A proof would involve considering what would happen to the general point (x, y). Under a reflection over the x-axis, this would go to $(x, -y)$. After a further reflection over the y-axis, this would become $(-x, -y)$. This is the same as the general point (x, y) being rotated through180° around the origin.

Students should be encouraged to look for other possible combinations in their card arrangements in the same way.

Whole-class discussion (15 minutes)

Give either a mini-whiteboard, pen, and eraser, or a piece of squared paper to each group of students.

Use Slides P-5 and P-6 of the projector resource to support a whole-class discussion.

Ask students to do the following transformations using the coordinate grid on the transparency *Transformations*, then to write the new coordinate on their mini-whiteboard:

Use the transparency Transformations. Mark the coordinate (1, 4) on the coordinate grid.

Show me the new coordinates of the point (1, 4) after it is:

- *Reflected over the x-axis.* $(1, -4)$
- *Reflected over the y-axis.* $(-1, 4)$
- *Rotated through 180° around the origin.* $(-1, -4)$
- *Reflected over the line $y = x$.* $(4, 1)$
- *Reflected over the line $y = -x$.* $(-4, -1)$
- *Rotated through 90° clockwise around the origin.* $(4, -1)$
- *Rotated through 90° counterclockwise around the origin.* $(-4, 1)$

You may like to repeat this with a general starting point (x, y).

Show me the new coordinates of the general point (x, y) after it is:

- *Reflected over the x-axis.* $(x, -y)$
- *Reflected over the y-axis.* $(-x, y)$
- *Rotated through 180° around the origin.* $(-x, -y)$
- *Reflected over the line y = x.* (y, x)
- *Reflected over the line y = – x.* $(-y, -x)$
- *Rotated through 90° clockwise around the origin.* $(y, -x)$
- *Rotated through 90° counterclockwise around the origin.* $(-y, x)$

It may be helpful to write the new coordinates on the board, to be able to extend discussions to include combinations of transformations:

What is the single transformation that will produce the same result as:

- *A rotation of 90° clockwise around the origin, followed by a reflection in the y-axis?*

[This is a reflection in the line y = −x.]

Show me two transformations that can be written as a single transformation.

Show me two transformations that cannot be written as a single transformation. Can you change the starting point of the shape so that it can be written as a single transformation?

Follow-up lesson: improving individual solutions to the assessment task (10 minutes)

Return their original assessment task *Transformations* to the students, together with a blank copy of the task.

Look at your original responses and think about what you have learned this lesson.

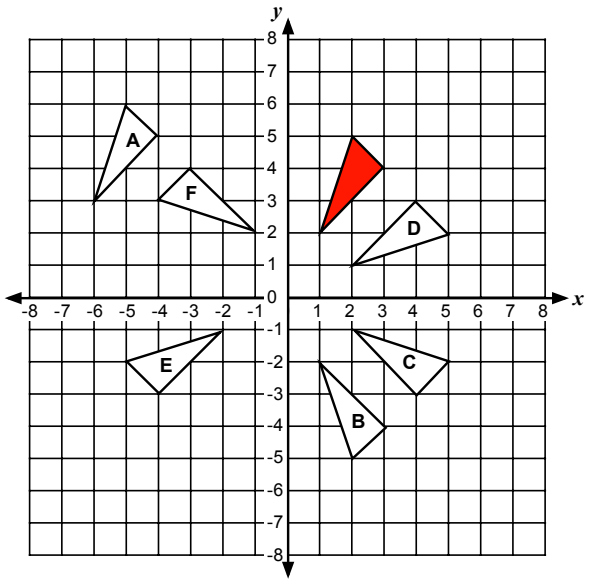
Using what you have learned, try to improve your work.

If you have not added questions to individual pieces of work then write your list of questions on the board. Students should select from this list only those questions they think are appropriate to their own work.

Some teachers give this for homework.

SOLUTIONS

Assessment Task: *Transformations*



2a. Reflection over the line $y = -x$.

2b. Rotation 90° counterclockwise around (0, 1).

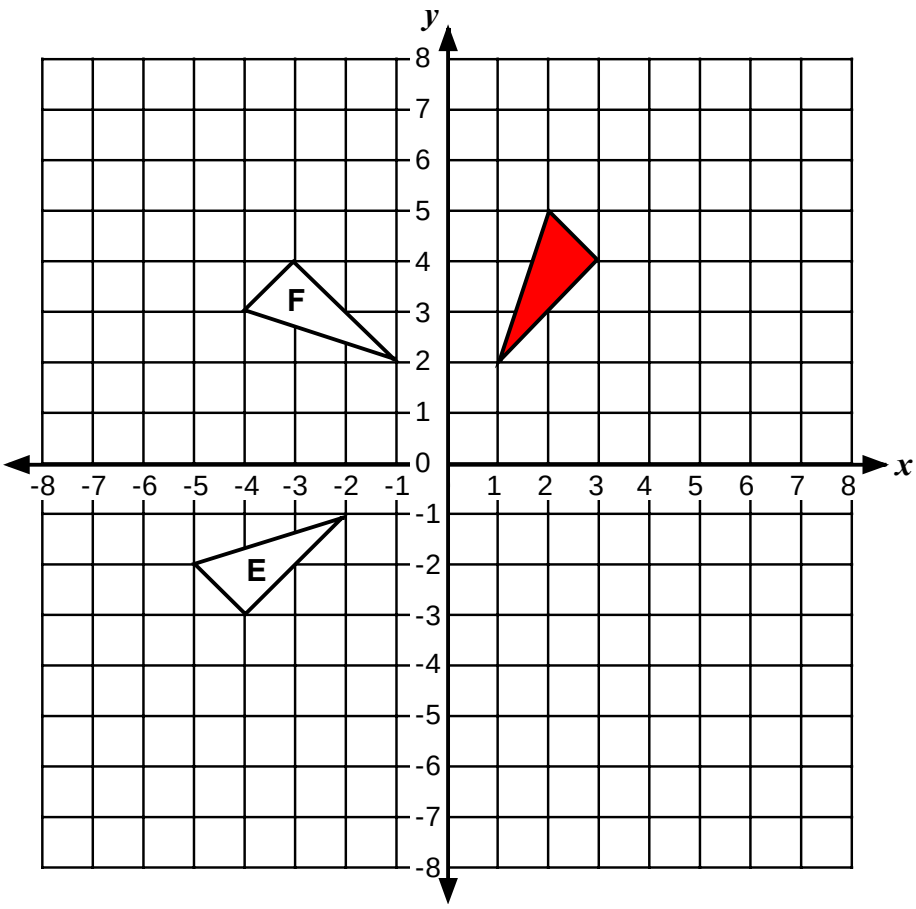
3. Reflection over the line $y = x$.

Collaborative work

The following connections exist between pairs of shape cards:

Pairs of shapes	Transformation	Pairs of shapes	Transformation
A onto B	Reflection over the x-axis.	B onto F	Translation +2 units horizontally and –2 units vertically.
F onto D	Clockwise rotation of 90° around (2,0).	D onto E	Reflection over the y-axis.
E onto C	Reflection over the line y = x.	C onto A	Reflection over the y-axis.
A onto D	Reflection over the line y = –x.	C onto B	Rotation of 180° around the origin.
A onto E	Clockwise rotation of 90° around the origin.	B onto D	Clockwise rotation of 90° around the origin.
D onto C	Clockwise rotation of 90° around the origin.	B onto E	Reflection over the line y = –x.

Transformations



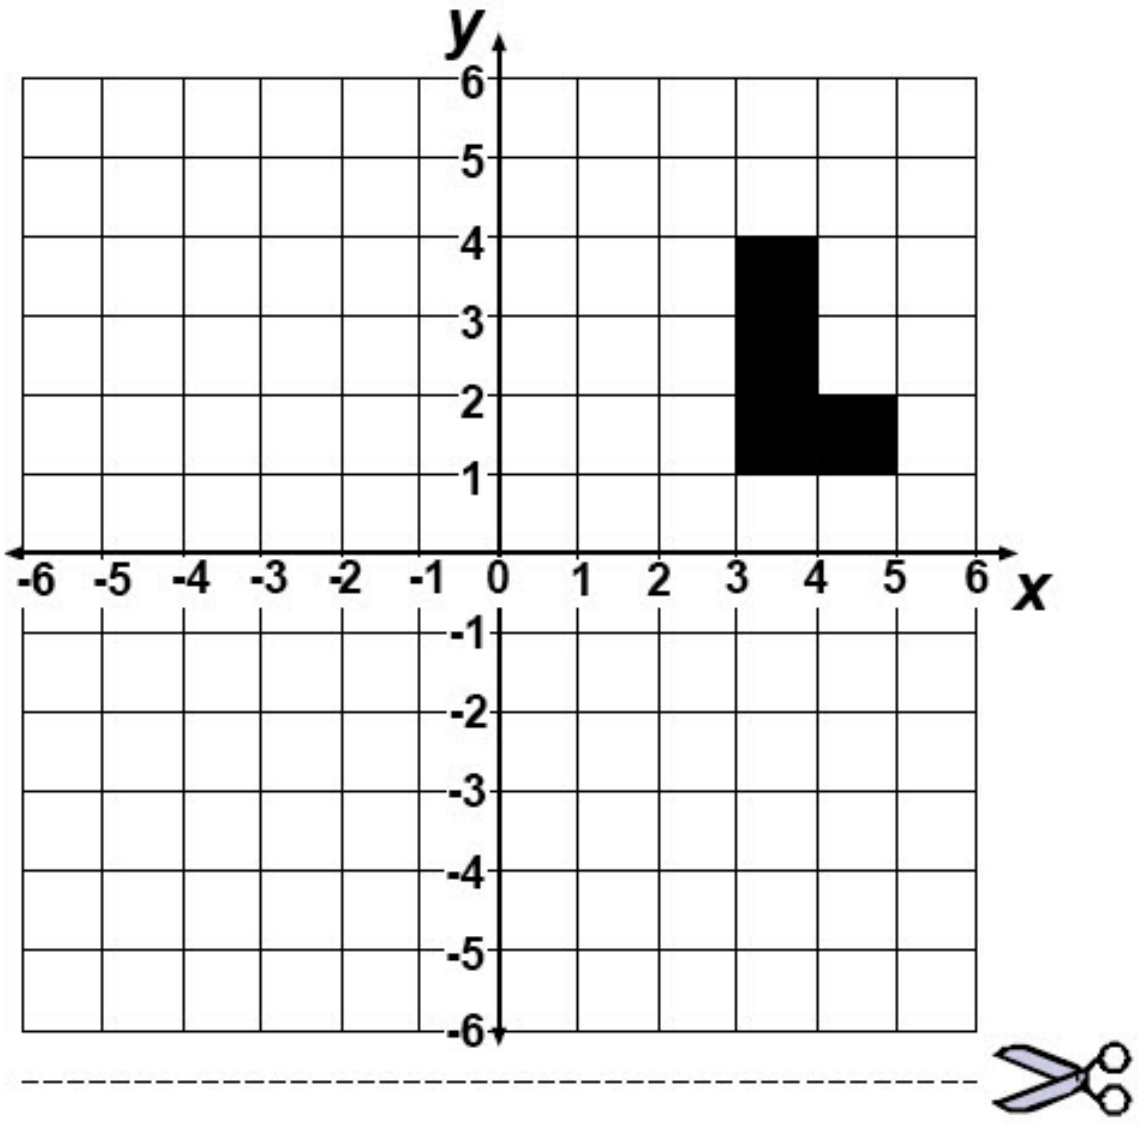
1. Draw the shaded triangle after:
   a) It has been translated −7 horizontally and +1 vertically. Label your answer *A*.
   b) It has been reflected over the *x*-axis. Label your answer *B*.
   c) It has been rotated 90° clockwise around the origin. Label your answer *C*.
   d) It has been reflected over the line $y = x$. Label your answer *D*.

2. Describe fully the single transformation that:
   a) Takes the shaded triangle onto the triangle labeled *E*.

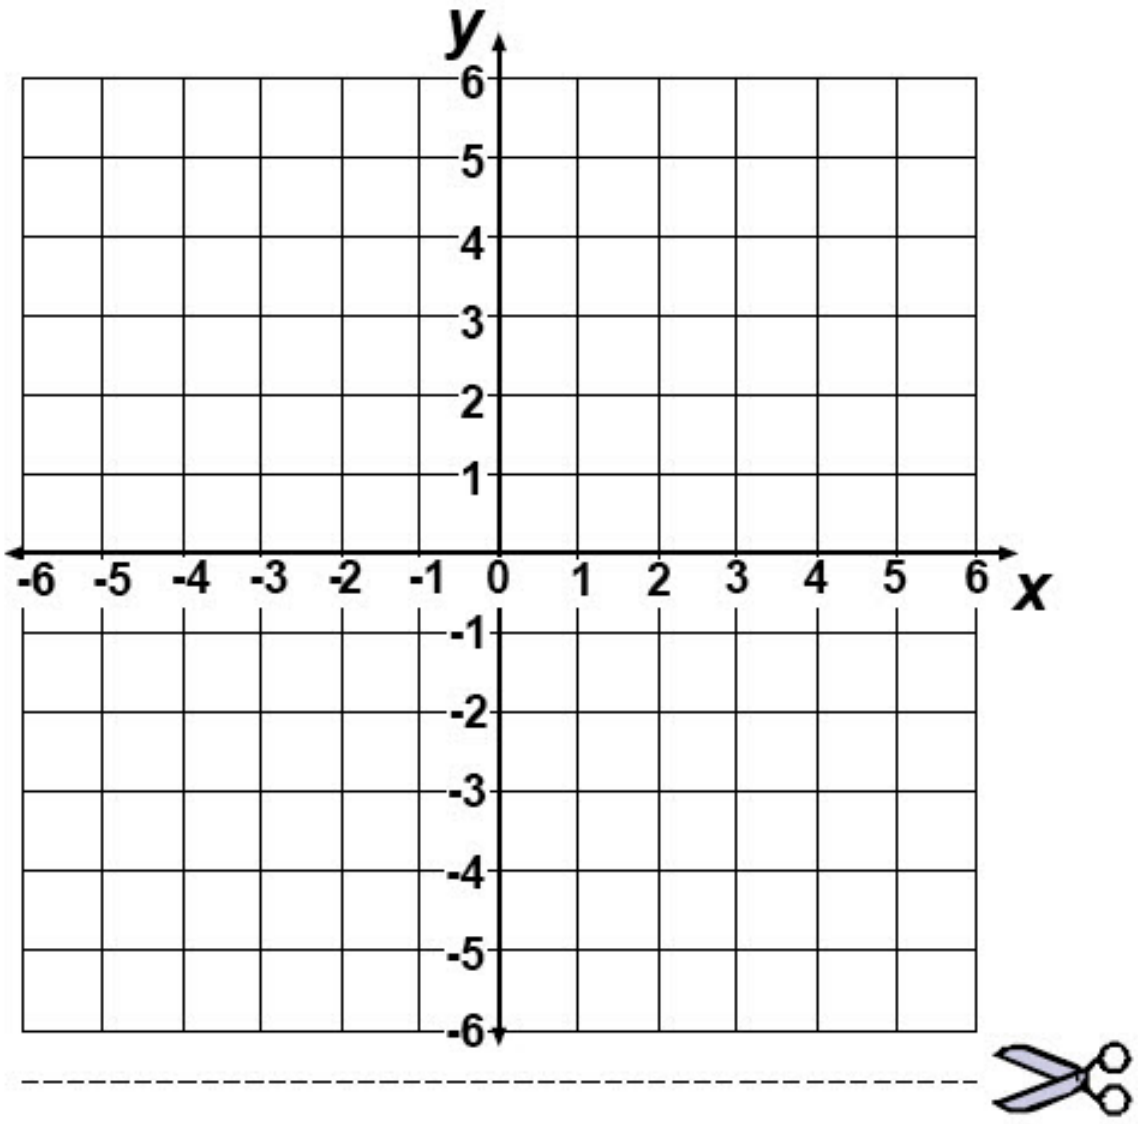
   b) Takes the shaded triangle onto the triangle labeled *F*.

3. Describe a single transformation that has the same effect as rotating a shape 90° clockwise around the origin, then reflecting the result over the x-axis.

Transparency: L-Shapes

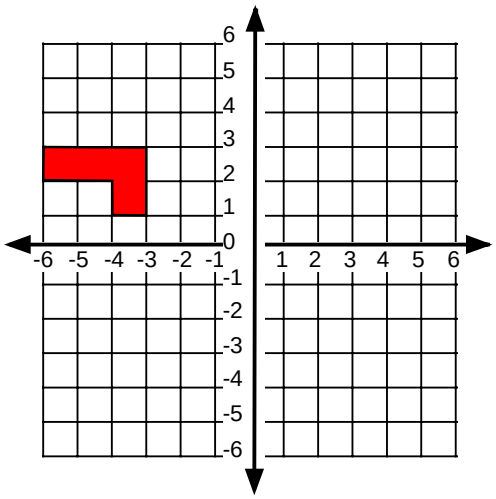


Transparency: Transformations

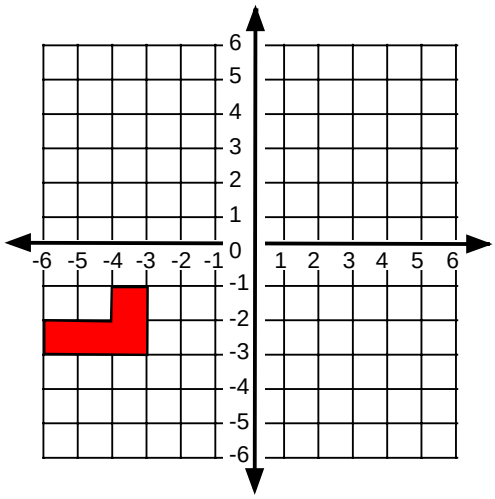


Card Set A: Shapes

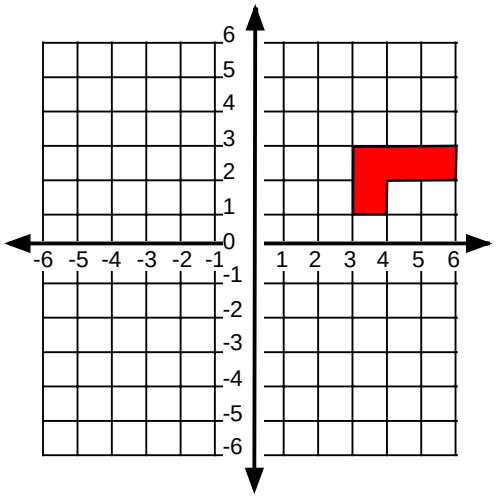
Shape A



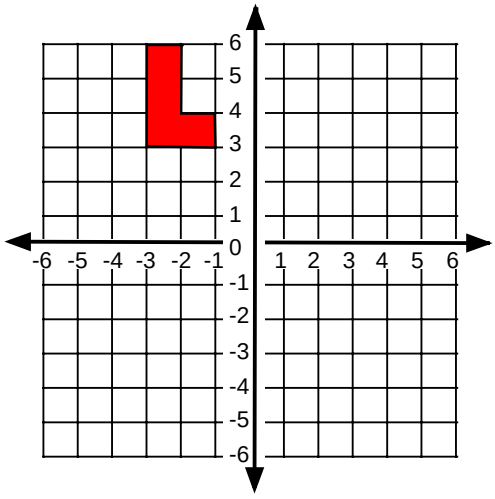
Shape B



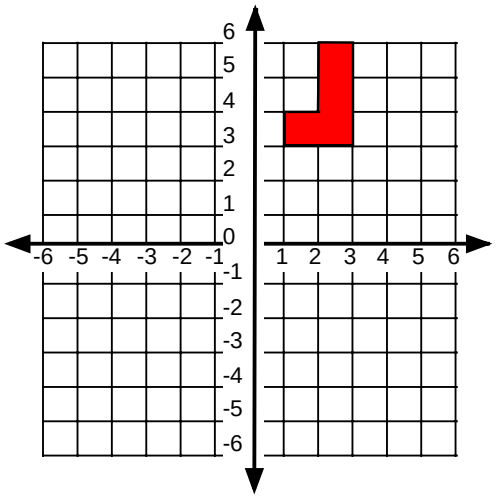
Shape C



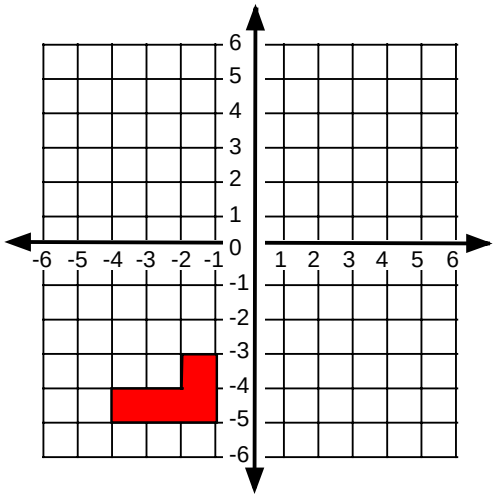
Shape D



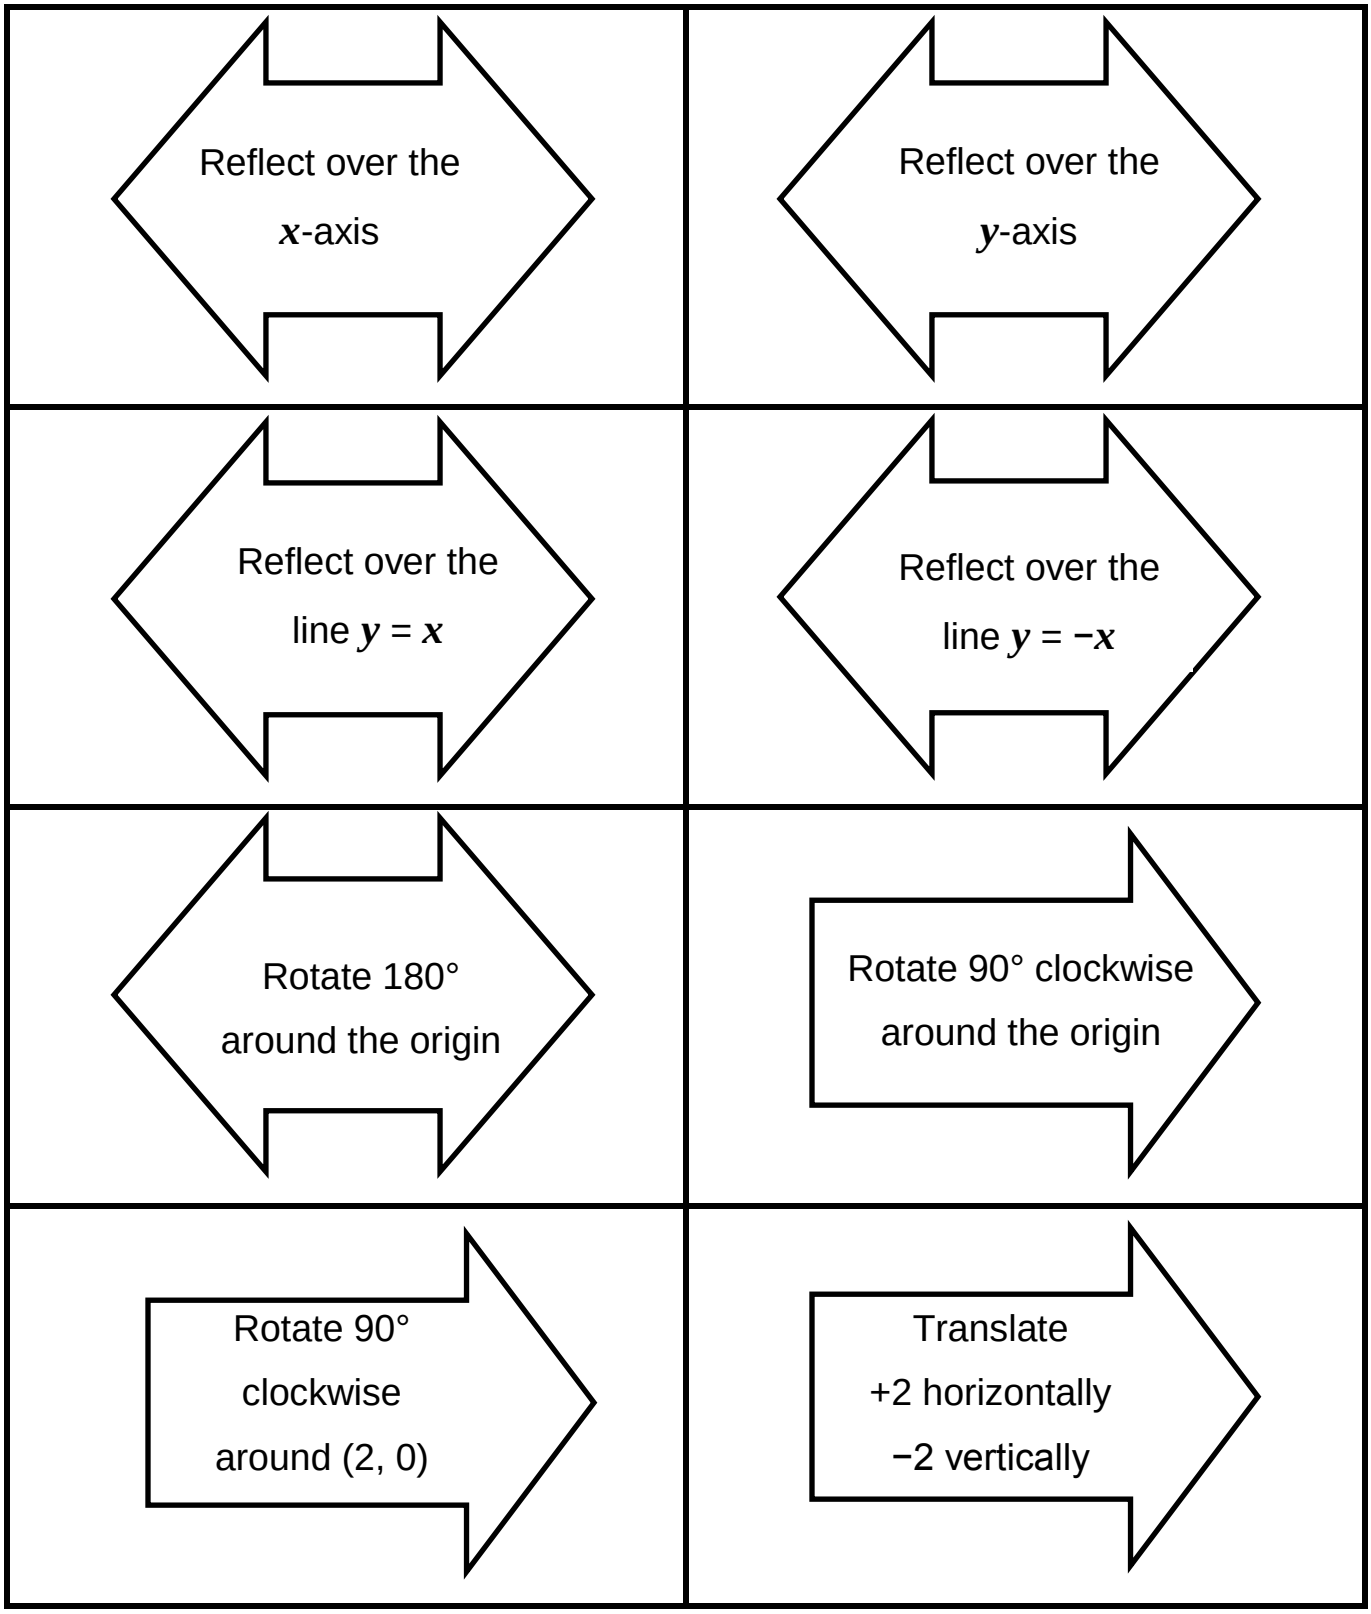
Shape E



Shape F



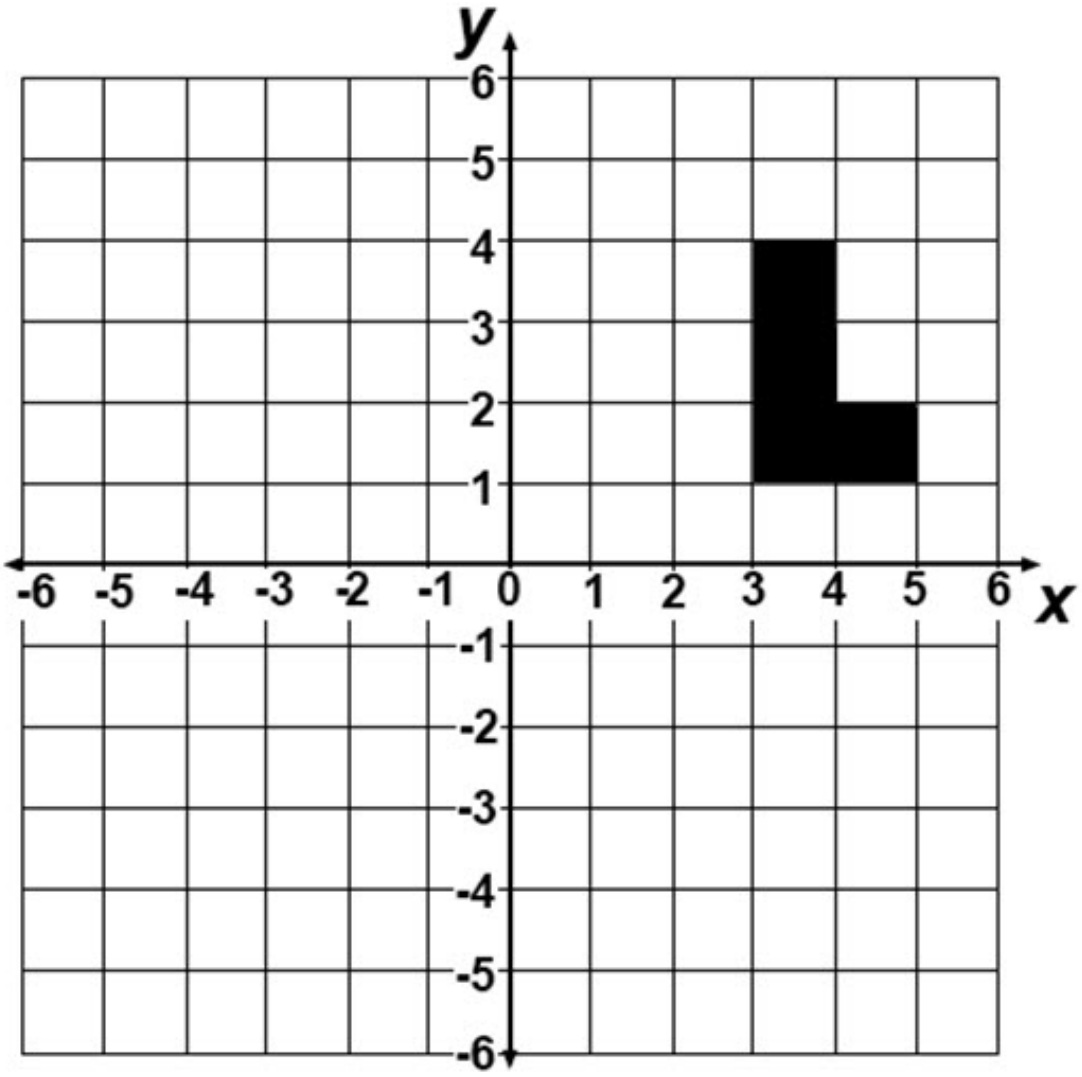
Card Set B: Words



Card Set C: Additional Words

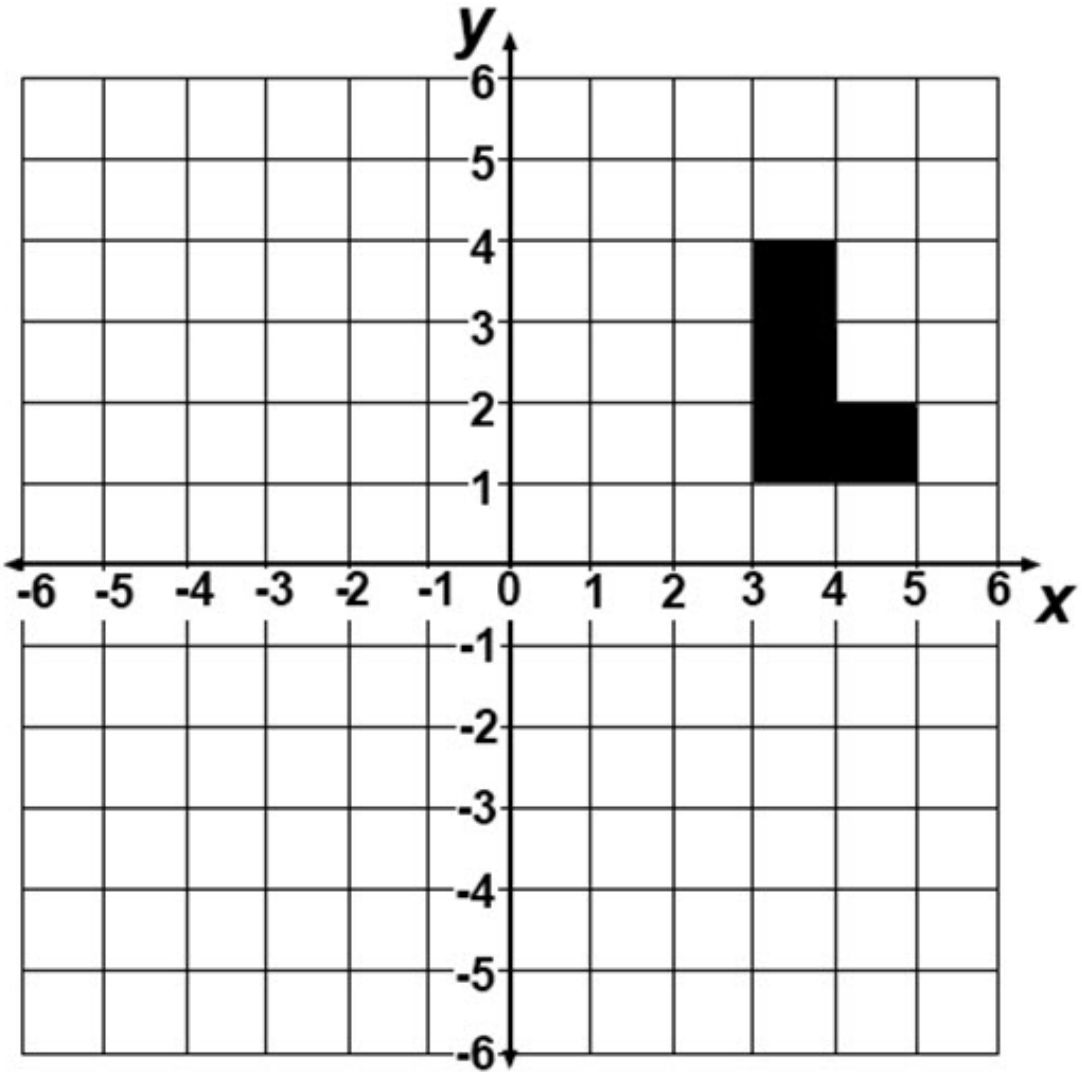
Reflect over the	Reflect over the .....
Reflect over the	Reflect over the .....
Rotate 180° around	Rotate 90° clockwise around .....
Rotate 90° counterclockwise around	Translate ....

Translation



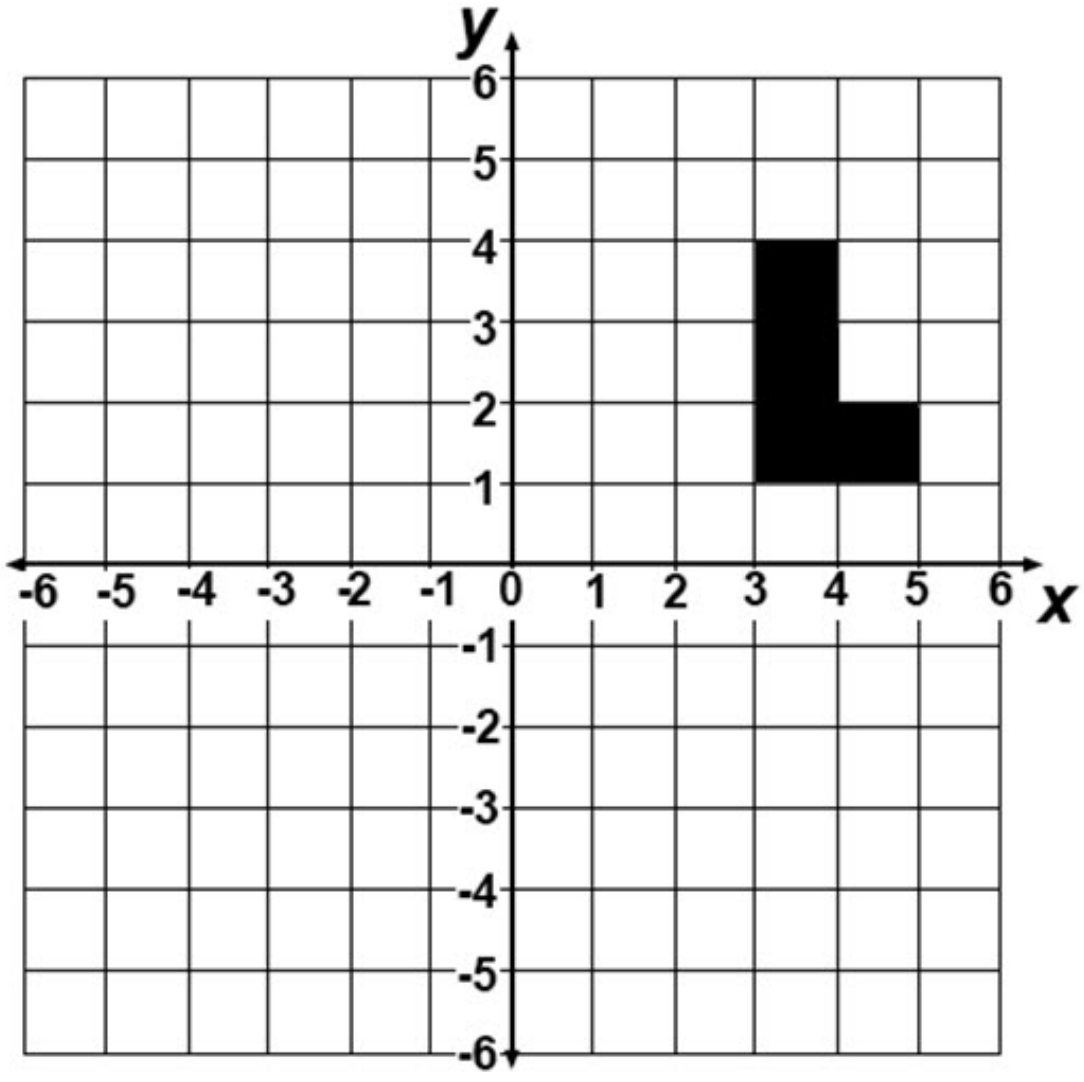
Where will the L-shape be if it is translated by −2 horizontally and +1 vertically?

Reflection



Where will the L-shape be if it is reflected over the line $x = 2$?

Rotation



Where will the L-shape be if it is rotated through 180°around the origin?

Matching Cards

1. Take turns to match two shape cards with a word card. Each time you do this, explain your thinking clearly and carefully.
2. Your partner should then either explain that reasoning again in his or her own words, or challenge the reasons you gave.
3. It is important that everyone in the group understands the placing of a word card between two shape cards .
4. Ultimately, you want to make as many links as possible.
5. If possible, use all the shape cards, and all the word cards.

Starting point (1, 4)

Show me the new coordinates of the point (1, 4) after it is:

- Reflected over the x-axis
- Reflected over the y-axis
- Rotated through 180°about the origin.
- Reflected over the line $y = x$.
- Reflected over the line $y = -x$.
- Rotated through 90°clockwise about the origin.
- Rotated through 90°counterclockwise about the origin.

General starting point (x, y)

Show me the new coordinates of the point (x, y) after it is:

- Reflected over the x-axis
- Reflected over the y-axis
- Rotated through 180°about the origin.
- Reflected over the line $y = x$.
- Reflected over the line $y = -x$.
- Rotated through 90°clockwise about the origin.
- Rotated through 90°counterclockwise about the origin.

Mathematics Assessment Project

Classroom Challenges

These materials were designed and developed by the
Shell Center Team at the Center for Research in Mathematical Education
University of Nottingham, England:

Malcolm Swan,
Nichola Clarke, Clare Dawson, Sheila Evans, Colin Foster, and **Marie Joubert**
with
Hugh Burkhardt, Rita Crust, Andy Noyes, and **Daniel Pead**

We are grateful to the many teachers and students, in the UK and the US,
who took part in the classroom trials that played a critical role in developing these materials

The classroom observation teams in the US were led by
David Foster, Mary Bouck, and **Diane Schaefer**

This project was conceived and directed for
The Mathematics Assessment Resource Service (MARS) by
Alan Schoenfeld at the University of California, Berkeley, and
Hugh Burkhardt, Daniel Pead, and **Malcolm Swan** at the University of Nottingham

Thanks also to Mat Crosier, Anne Floyde, Michael Galan, Judith Mills, Nick Orchard, and Alvaro Villanueva who contributed to the design and production of these materials

This development would not have been possible without the support of
Bill & Melinda Gates Foundation

We are particularly grateful to
Carina Wong, Melissa Chabran, and **Jamie McKee**

The full collection of Mathematics Assessment Project materials is available from

http://map.mathshell.org
