Ann is in charge of a **Lucky Dip** to raise money for charities.

Each barrel contains an equal number of red, green, white and black balls.

The balls are buried in sawdust so that you cannot see them before you pick one out.

To play the game, you give Ann your 25¢, then you pick one ball from each barrel.

You win $5 if all three balls are the same color.

1. Calculate the probability that you will win the $5 if you play once.

$\frac{1}{16}$ ✓ |

$16 \times 4 = 64$ $\frac{4}{64} = \frac{1}{16}$

2. Do you think that the **Lucky Dip** will raise money for the local charities?   No

Show your calculations. $0.25 \times 16 = 4$ ✓

16 turns = $4 gained.
$5 prize.
$ -1 lost. ✓

3. Ann wants to change the game so as to increase the amount of money it makes for the charities.

Describe two different kinds of change that she could make to the **Lucky Dip** and find how much is likely to be raised for the charities after each change.
Show all your calculations.

Change one

75¢ a chance ✓

75¢ a chance; get 3 balls the same color; win $.5. Calculations

$16.4 = 64 \frac{4}{4} = \frac{1}{16}$, $0.75 \times 16 = \$12$. In 16 turns, it will raise $12 but one person will win causing a decrease in $5 Basically in 64 turns the game will raise $11. Using ratios, you raise $0.171875 every time same one takes a turn. ✓

Change two

more panels ✓

Have an extra panel, 75¢ a chance. Get 4 balls, win $5 Calculations.
All same color $= 4 \times \frac{1}{4} \times \frac{1}{4} \times \frac{1}{4} \times \frac{1}{4} = \frac{1}{64}$. If 64 turns it will raise $48, but one person will be winning causing a decrease of $5, so $48 - $5 = $43. So they could drop the price down to persuade more people to play. So at 25¢ it would be $16 - $5 = $11 win.

3. Ann wants to change the game so as to increase the amount of money it makes for the charities.

Describe two different kinds of change that she could make to the **Lucky Dip** and find how much is likely to be raised for the charities after each change.
Show all your calculations.

N = # of people playing

Change one

$\frac{11}{16}N$

Increase the amount of money to play to $1. Now the price ratio is 5; chance of winning is $\frac{1}{16}$. Multiply them to get $\frac{5}{16}$ which is less than 1. Therefore, Ann will make more money. If n people come to play, n is large, Ann's income will be 1·n. Price money = $\frac{1}{16}$·n·5 = $\frac{5}{16}$n. Money to charity = 1n − $\frac{5}{16}$n = $\frac{11}{16}$n.

Change two N = # of people playing

$\frac{11}{64}N$

Decrease the chance of winning to $\frac{1}{64}$ by making the player pick two balls of the same color out of the last barrel instead of one ball (all balls must be same color). Ann's income: 0.25·N
Players' income: $\frac{1}{64}$·N·5   0.25N − $\frac{5}{64}$N = $\frac{11}{64}$N. Money to charity:

$\frac{11}{64}$N

BOD assume with replacement.
